Abstract

In a previous paper we defined the black-and-white SAT problem which has exactly two solutions, where each variable is either true or false. We showed that black-and-white 2-SAT problems represent strongly connected directed graphs. In this work we would like to extend this result. We introduce Algorithm BalatonBoglár which can generate a 3-SAT problem out of a directed graph. We show that if the input graph is a strongly connected one, then the generated SAT problem is a black-and-white 3-SAT problem. In our previous work the main idea was the following: If a graph contains two edges: $a \rightarrow b$, and $a \rightarrow c$, then those can be represented by the formula: $(a \supset b) \land (a \supset c)$, which is equivalent to two 2-clauses $(\neg a \lor b) \land (\neg a \lor c)$. The new idea is the following: If a graph contains two edges: $a \rightarrow b$, and $a \rightarrow c$, then those can be represented by the formula: $(a \supset b) \lor (a \supset c)$, which is equivalent to $a \supset (b \lor c)$, which is equivalent to a 3-clause $(\neg a \lor b \lor c)$. This idea is not enough to have a black-and-white SAT formula in case of a strongly connected graph. We need to represent simple cycles of the graph, too. If $a_1 \rightarrow a_2 \rightarrow \cdots \rightarrow a_n \rightarrow a_1$ is a simple cycle with exit points $b_1, b_2, \ldots, b_m$ (which means that for some $i \in \{1 \ldots n\}$, and $j \in \{1 \ldots m\}$ we have $a_i \rightarrow b_j$ and $b_j \notin \{a_1, \ldots, a_n\}$), then this cycle can be represented by the clause: $(\neg a_1 \lor \neg a_2 \lor \cdots \lor \neg a_n \lor b_1 \lor b_2 \lor \cdots \lor b_m)$. Algorithm BalatonBoglár uses the trick that instead of detecting each simple cycle it generates from each path $a \rightarrow b \rightarrow c$ the following 3-clause: $\neg a \lor \neg b \lor c$ even if there is no cycle which contains the vertices $a$ and $b$. This simplification allows very fast 3-SAT model generation from a directed graph, even the model will be black-and-white 3-SAT if and only if the input directed graph is strongly connected. On the other hand this simplification does not tell us how to generate from a 3-SAT problem a directed graph, unless the 3-SAT problem is black-and-white.
